

RENOLD

WM Series

Worm Gear Units

WM Series - Product Specification

The WM Series range of products has been designed and built to a modular form to allow the combination of other Renold products to extend the torque, ratio and speed range. Each unit is designed for use with NEMA and IEC electric motors, with B5 and B14 flanges.

Applications:

- Conveyors
- Mining
- Lumber
- Textiles
- Materials Handling
- Packaging Machinery
- Food Process Machinery
- Water Treatment
- Founding Equipment
- General Industrial Applications

Section of electron beam welded wormwheel rim and centre showing the fusion of the bronze wormwheel rim onto the cast iron centre. This high security fit allows transmission of power under shock load conditions.

Introduction

For over 100 years, Renold has played a leading role in the development of worm gearing and perfected the design and manufacture of HOLROYD worm gears, such that today the name HOLROYD is renowned world-wide for the quality and reliability of its products.

Renold WM Series worm gear units are available to satisfy the industrial demand for reliable and efficient speed reducers.

Renold WM Series worm gear units are single reduction and utilise the unique Renold patented electron beam welded wheel rims. Double reduction units are available - contact Renold.

Standard speed reduction ratios range from 5:1 up to 70:1 for single reduction worm gear units.

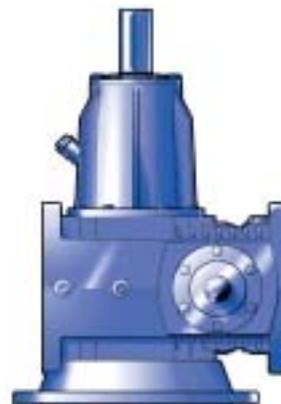

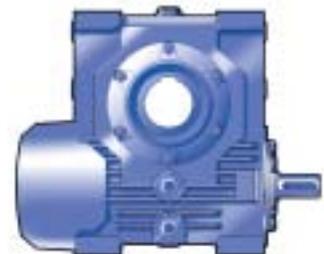

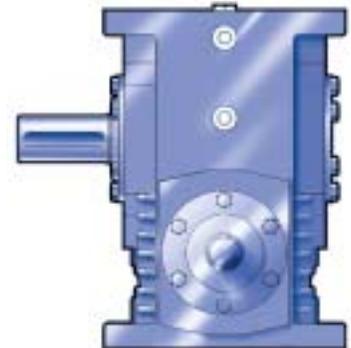

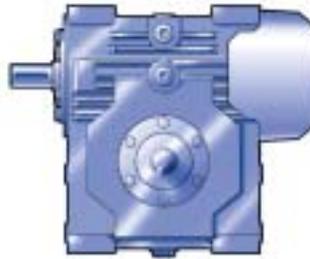

All WM Series worm gear units can be supplied in various standard types and assemblies and are suitable for combining with most of the other Renold range of fixed and variable speed products.

Most of the units included in the WM Series range are suitable for mounting in alternative positions. Available assemblies are detailed for each type of unit and mounting position variations where applicable.

WM Series reducers are supplied with a hollow shaft as standard except for the 9" CRS which has a solid shaft. Plug-in output shafts, both single and double, are available for both standard mount and flange mount.

All of the WM Series units can be fitted with standard flange mounted electric motors.

The WM Series units are available from 4" to 9" centre distance and this heavy duty unit range is the result of continuing research and development.

WM Series - Product Specification

Gear Case

The gear cases are of close grained cast iron with all joints and bearing bores accurately machined to ensure oil tightness and precise gear location.

Wormshaft and Wormwheel

The worm is integral with its shaft and manufactured from alloy steel, casehardened on the threads and ground and polished on the thread profiles.

The wormwheel rim is made from bronze complying with BS 1400 PB2-C (centrifugally cast) and secured to the cast iron centre by the electron beam welding process.

The Holroyd gear form used in the WM Series gear units corresponds to British Standard recommendations but, in addition, has an exclusive feature which consists principally of an important modification to the worm threads and wheel teeth which confer additional valuable properties to gear performance. This ensures that our gears will run correctly and transmit true uniform angular velocity when running under all load conditions. The modification also gives a tapered oil entry gap between the teeth, which drags the lubricant between the surfaces and results in more efficient lubrication. Standard worm gears have right-hand threads but left-hand threads can be made to order.

Shafts

Standard shaft extensions are to imperial dimensions, but metric shaft extensions are also available. The output Shaft is manufactured in carbon steel, but if required by applicational conditions, can be made from high tensile steel, in single or double extension.

WM Series unit sizes 4" to 8" are supplied as hollow output shaft type as standard and all output shafts are plug-in design, single and double extension.

The Agitator version WMA however uses a solid output shaft construction for maximum strength, particularly when used on mixer applications. The WM 9 Series units are supplied with solid construction output shaft throughout the range of design types. All input shafts in the WM Series range are standard double extension and are metric dimensions at one end and American standard - inch at the other.

Unless otherwise requested, the imperial extension will be the exposed input extension.

Preferred Ratios

Certain gear ratios have been nominated as preferred ratios and are shown in red on pages 28 to 41. This has been done with a view to providing a competitive lead time.

Bearings

Standard metric taper/roller bearings are fitted throughout the WM Series range of units in both single and double extension shaft options.

Oil Seals

Semi-dual lip oil seals are fitted to all hollow output shaft units and single lip seals are fitted to the input shaft of all unit sizes and the output of WM9 unit range and all agitator unit types.

Dry Well Feature

The WM Series unit sizes 4" to 8" can be factory fitted with a 'dry-well' adaption at the output shaft to create a non oil leak unit. The output shaft bearing within the dry well is grease lubricated.

The non leak feature is particularly important on mixer drive applications in food and chemical plants where the unit shaft is vertically down.

Lubrication

Gear and bearings are positively lubricated by oil from the sump in the underdriven and overdriven versions at normal motor speeds. With the vertical and agitator types, grease lubrication is necessary to the wheel line bearings.

For lower speeds it may be necessary to consider grease lubrication of certain bearings and in this instance it is advisable to consult with Renolds Engineers. Full lubrication details can be found under the "Installation & Maintenance" section.

Cooling

Maximum heat dissipation by air cooling is carried out by radial fan directing air over ribbed gear case. Where applicational circumstances permit, standard units can be supplied without a fan.

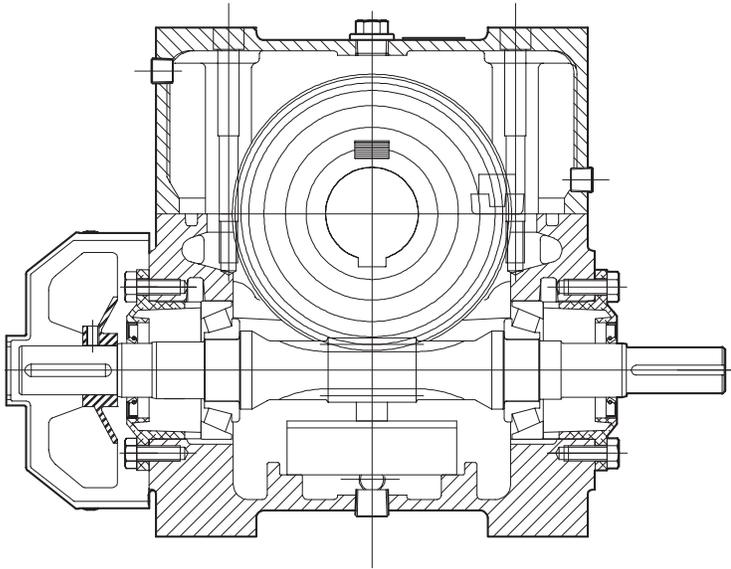

Backstop

Sprag clutch backstops can be fitted to most units to prevent unit run back when required.

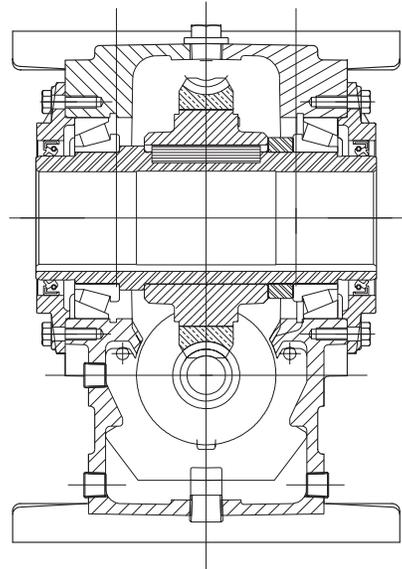

Double Reduction Units

Two stage, double reduction gear units are available with ratios from 75:1 to 4900:1.

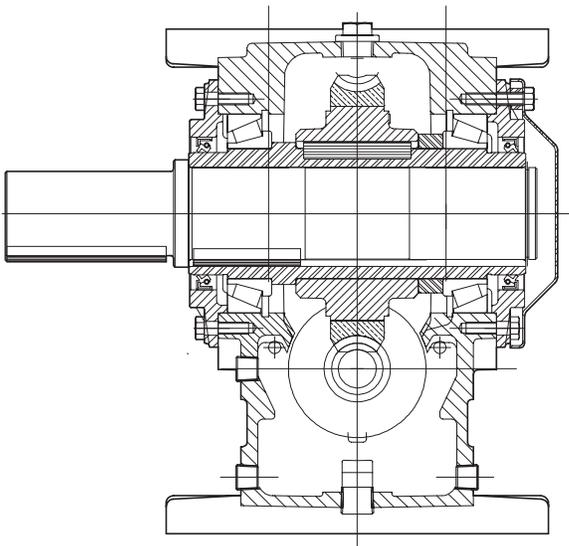

WM Series - Product Specification

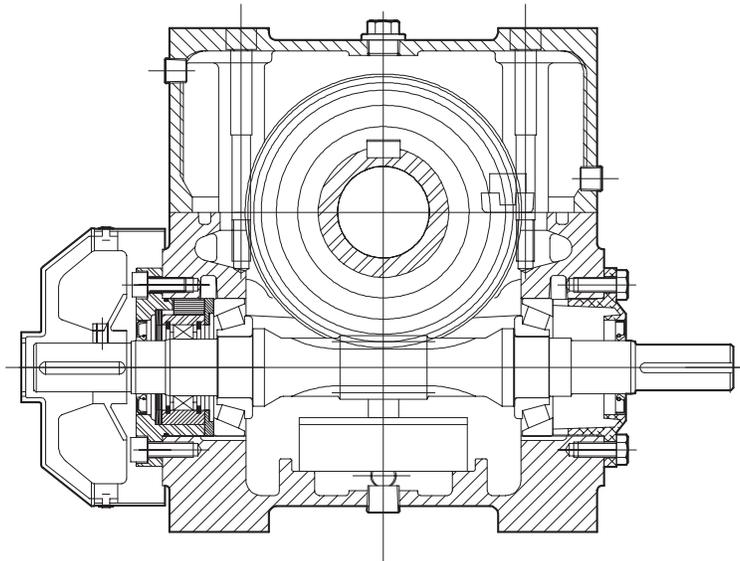

Hollow output shaft unit showing standard American extension input shaft and metric extension at the fan end.

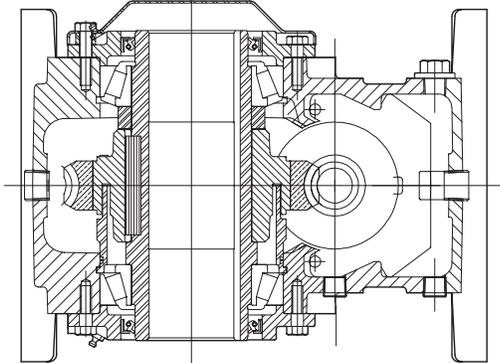

Standard hollow output shaft with semi dual lip oil seal for added oil retention.

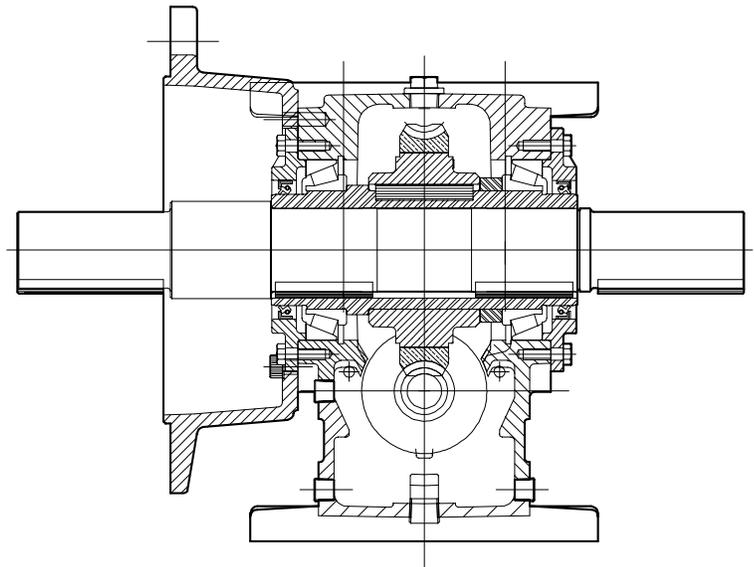

Underdriven unit with standard plug-in output shaft. Single and double extension shafts are available.

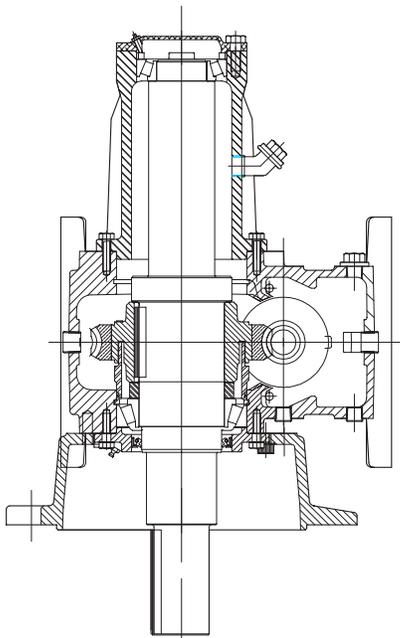

Sprag Clutch, anti run-back assembly fitted to the fan extension end of the input shaft, to prevent unit run back. The Sprag Clutch can be supplied as a kit for retro fitting at any time.

WM Series - Product Specification

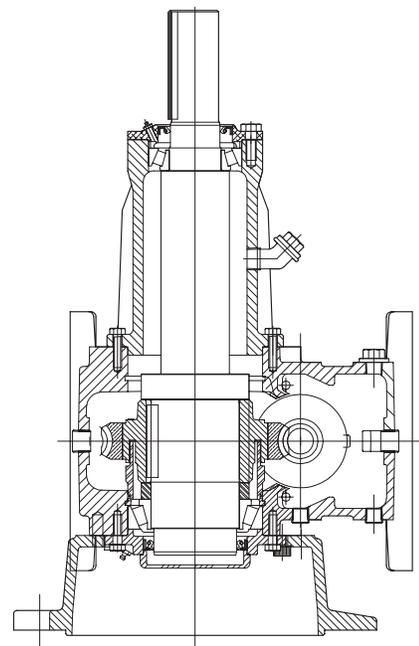

Dry well adaption fitted at the output of the WM Series unit. The non leak feature is particularly important on mixer applications in the food and chemical industry.

Unit fitted with output location flange and double extension output shaft, one standard extension and one longer than standard compensating for the flange.

WMA - Agitator unit with solid output shaft down. The unit is shown with the dry well feature. The output shaft bearings have a greater bearing span to allow for higher external loads imposed by mixer and agitator blades.

Agitator unit with solid output shaft up, particularly suited for cooling fan drives.

Selection of Worm Gears

To select a worm gear unit the following basic information must be known and, if we are to make the selection, should be submitted in full to our Technical Sales Department.

Power

- Prime mover, type and output power (HP).
- Gear unit input and output power required (HP).
- For input speeds below 250 rev/min consult our Technical Sales Department, giving details of required output torque (lbf.ins) and diameter of driven shaft (ins).

Speed

Gear unit input and output rev/min.

Duty

- The characteristics of the drive eg. degree of impulsiveness of the driven load.
- Duration of service in hours/day.
- Starting load (HP) and number of starts per day.
- For intermittent duty, reversing or shock loading, state normal power (HP) and frequency.
- Disposition and details of external loads imposed on input/output shafts.
- Working conditions, i.e. clean, dusty, moist, abnormal temperatures etc.

If the operating conditions are in any way unusual it is advisable to consult our Technical Sales Department.

Enquiry/Ordering Procedure

At the order or enquiry stage, please quote the catalogue reference, shaft assembly number and nominal ratio or exact ratio if this is important (see tables). Non-standard mounting positions should be indicated with a sketch. Where a double extension wormwheel shaft is required, please state any special requirements regarding alignment of keyways.

Mechanical Rating

The mechanical powers listed are those which the WM Series class units will transmit for 10 hours each day and correspond to a service factor of 1.0. Where non-uniform loading or a working day other than 10 hours is involved, a service factor f_d should be applied to the selection power or torque which is taken from Table 2.

High numbers of starts per hour also influence the mechanical selection. Table 3 shows the starts factor f_s which should also be applied to the selection power or torque.

For guidance, a comprehensive list of the various load conditions for a number of applications is given in Table 1. When confirming the mechanical selection powers therefore, the rating must be equal to or greater than - calculated power or torque demand x application service factor f_d (Table 1 and Table 2) x starts factor f_s (Table 3)

Efficiencies

The efficiency figures are approximate only and are those that could be expected from a gearbox which is fully run-in and operating under full load with the lubricant at its full working temperature.

For intermittent rating where the lubricant may remain comparatively cool, the efficiency may be somewhat lower due to the increased oil churning losses associated with the higher viscosity of the cool oil.

We shall be pleased to advise on any particular application.

Thermal Rating

The thermal ratings given are those which the gear units will transmit at an ambient temperature of 20°C (68°F), when the heat generated within the gearbox is being dissipated at the same rate. Whilst these ratings can be exceeded under start up conditions, this situation could lead to overheating and subsequent damage if continuously applied.

Thermal torque ratings do not relate to mechanical gear life and are not affected by running time or momentary shock loads.

If the ambient temperature is likely to exceed 20°C (68°F), this situation will have to be taken into account in the selection procedure. This is done by applying the thermal service factor given in Table 4 when calculating the selection output torque.

Eg. Thermal selection torque = continuous torque requirement x thermal service factor f_t . Where intermittent running is involved it is possible the thermal limitation can be ignored, such as on a crane or winch application and when this type of operation is being considered; full applicational details should be given to Renold for assessment.

Selection Procedure

The ratings tables for the single reduction wormgear units provide mechanical ratings in terms of input and output power in HP and mechanical and thermal output torque ratings in lbf.ins.

Tables 1 and 2 list the service factors relative to the operational hours each working day and the load classification with regard to the nature of the service. When determining the selection power, the actual power absorbed and not the rating of the prime mover should be used.

The procedure is as follows for single reduction units:-

- Establish the ratio required by dividing the input speed by the output, choosing the nearest nominal ratio available from tables 8 and 9.
$$\text{Gear ratio} = \frac{\text{Input speed rev/min}}{\text{Output speed rev/min}}$$
- Determine the load classification from Table 1 and the corresponding mechanical service factor f_d from Table 2 and the starts factor f_s from Table 3.
- Multiply the actual power absorbed by the mechanical service factor f_d and tentatively select the size of unit by comparing this against the mechanical rating appropriate to the ratio and input speed.
Selection Output Torque =
actual output torque x f_d x f_s
or
Selection Output Torque =
$$\frac{\text{absorbed power} \times 63,025 \times f_d \times f_s}{\text{output speed (rev/min)}}$$
- For continuous operation, check that the thermal rating is at least equal to the thermal torque requirement. External cooling can be offered to increase thermal rate.
Thermal torque requirement = continuous torque x thermal service factor f_t from Table 4.
- Check the capability of the unit to withstand external loads applied to the output shaft. See Tables 5 and 6.

Selection Examples + Nominal and Actual Ratios

Mechanical Selection Torque	lbf. ins =	Actual Torque Requirement	(lbf. ins)	X	Mechanical Service Factor	(fd)	X	Starts Factor	(fs)
Thermal Selection Torque	lbf. ins =	Actual Torque Requirement	(lbf. ins)	X	Thermal Service Factor	(ft)			
Mechanical Selection Power	(HP) =	Actual Power Requirement	(HP)	X	Mechanical Service Factor	(fd)	X	Starts Factor	(fs)
Thermal Selection Power	(HP) =	Actual Power Requirement	(HP)	X	Thermal Service Factor	(ft)			

Example 1

A right angled underdriven wormgear unit is required to drive a belt conveyor with steady load conditions for 12 hours per day, continuous running. The ambient working temperature is 20°C (68°F) and the prime mover is an electric motor running at 1800 RPM nominal speed. Headshaft torque is 18,500 lbf.ins. The gear unit ratio would be 20/1.

- Mechanical Service (fd) Factor = 1.25
- Starts Factor (fs) = 1.00
- Thermal Service Factor (ft) = 1.00
- Mechanical Selection Torque (lbf.ins) = Actual Torque (lbf.ins) x fd x fs
= 18,500 x 1.25 x 1
= 23,125 lbf.ins
- Thermal Selection Torque (lbf.ins) = Actual (lbf.ins) x ft
= 18,500 x 1.00
= 18,500 lbf.ins

6. An 8" centre distance unit would be selected at 20/1 ratio using mineral oil. However, if synthetic oil could be used, the 7" centres unit would be suitable for the application, having a mechanical torque capacity of 24,650 lbf.ins and thermal capacity of 33,642 lbf.ins.

It can be seen from the ratings tables on pages 18 to 31 that both mineral and synthetic oil ratings are included. Depending upon which type of oil is to be used inside the gear unit will determine which rating are used to make a selection.

Example 2

A wormgear unit is to be used on a heavy duty application, run at 24 hours per day continuous duty, maximum ambient temperature 40°C (105°F). The unit ratio is to be 60/1 and the electric drive motor is 1800 RPM nominal speed (1750 RPM actual).

The demand power from the motor is 3.75 HP.

- Mechanical Service Factor (fd) = 2.00
- Starts Factor (fs) = 1.00
- Thermal Service Factor (ft) = 1.35
- Mechanical Selection Power (HP) = Actual HP x fd x fs
= 3.75 x 2.0 x 1.0
= 7.5 HP
- Thermal Selection Power (HP) = Actual HP x ft
= 3.75 x 1.35
= 5 HP
- The selection for this application would be a 6" centres unit at 60/1 ratio using mineral oil. The unit mechanical power rating is 8.46 HP and the thermal power rating is 13.7 HP. Either mineral or synthetic oil could be used.

Temp °F	50	68	86	105	122	140
Factor f_T	0.87	1.0	1.16	1.35	1.62	1.97

Overhung and Thrust Loads

Output shafts of worm gear units are frequently fitted with a spur pinion, chain pinion or belt pulley causing an overhung load to be imposed on the output shaft and bearings. These loads can generally be sustained by the gear unit; however, if the load is greater than the maximum allowable load for the unit, it may be necessary to either select a larger unit or lessen the effect of the load on the shaft bearings. This can be done in two ways. The pinion can be mounted on a shaft in its own bearings and the shaft coupled to the gear unit; or the wheel shaft may be extended beyond the overhung load and fitted with an outboard bearing. In order to obtain the best possible arrangement for a particular application (where large overhung loads are anticipated) customers are advised to submit details of the load to our Sales Technical Staff for their consideration.

In the interests of good design, the overhung member should be fitted as close as possible to the gear case in order to minimise the stresses and reduce the deflecting moment on the unit.

The maximum imposed axial thrust and overhung loads to which the units can be subjected are given in Tables 5 and 6.

Imposed axial thrust loads can also be minimised by the use of flexible couplings on the input and output shafts.

For drives where both imposed thrust and overhung loads are encountered, it is advisable to consult our Technical Sales Staff.

Where a double extension shaft is fitted, the maximum overhung loads listed apply in full to each shaft extension.

The overhung load may be calculated by the following formula:

resultant overhung load = (lbf)

$$\frac{P \times 126,000 \times F}{D \times S}$$

Where P = Power absorbed at output shaft (HP)

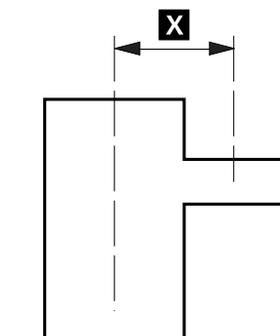

S = Speed of output shaft in rev/min

D = Pitch circle diameter of chain sprocket, spur or helical gear, or belt sheave in ins.

F = Overhung drive application factor as follows:

Chain sprocket	1,00
Spur or helical gear	1,25
Vee sheave	1,50
Flat belt sheave	2,00

Unit Size	Dimension X ins
	Standard Shaft
WM4	6.34
WM5	7.60
WM6	8.58
WM7	9.37
WM8	9.61
WM9	10.55

Installation and Maintenance

Initial running

All units are supplied without oil except for the jPM unit first stage reduction, used on WM Series unit sizes 4,5,6, and 7.

First filling

Single Reduction Units

When installed and before running, the unit should be filled with new lubricant to the correct level as follows.

With the gear stationary, remove the filler and breather plug and oil level plug. Fill until the lubricant level is visible at the indicator (if fitted) or until lubricant overflows from oil level aperture.

Replace and secure both plugs. Care should be taken to avoid overfilling, as this may cause subsequent leakage.

Starting up

All units have been subjected to a short test before despatch to the customer, but it takes many hours running under full load for the gear to attain its highest efficiency. The gear may, if necessary, be put to work immediately on full load, but if circumstances permit, it is better for the ultimate life of the gear to run it in under gradually increasing load attaining the full load after about 20 to 40 hours. Reasonable precautions should, however, be taken to avoid overloads in the early stage of running. Temperature rise on the initial run will be higher than that eventually attained after the gear is fully run in.

Routine maintenance

The oil level in the unit should be regularly maintained and should be checked at least once a month.

To avoid false readings, examination of the oil level should be made with the gear stationary and to maintain free ventilation of the unit under all conditions, the breather hole in the filler plug should be kept clear at all times. In the case of double reduction units, ensure that maintenance requirements given above are applied to both 1st and 2nd stage reduction gears.

Changing oil

The oil should be changed completely at intervals depending upon the working conditions.

Grease lubrication of bearings

Where this feature is included, the bearing caps are fitted with a grease nipple or stauffer lubricator, which should be used to lubricate the bearings.

When mounted with wormshafts vertical, the top bearing requires grease lubrication. Standard units, therefore, need to be modified by the inclusion of a grease nipple and nylos ring adjacent to the top bearing. Customers must advise us of this requirement when placing enquiries and orders.

Couplings and bedplates

All couplings should be carefully fitted and shafts accurately aligned.

To prevent damage to the bearings, coupling half-bodies should not be hammered on to shafts.

Worm gear units and other drive components should be rigidly mounted on firm foundations to prevent movement and vibration which may affect the alignment of the shafts. Suitable bedplates can be supplied if required.

Abnormal ambient temperatures

If the gear unit is to be operated under extremes of temperature or humidity, special oils may be required and recommendations will be made on request.

Storage

All worm gear units stored or left inactive for long periods should be adequately protected, particularly those on exposed sites and those operating in corrosive atmospheres. The following precautions will generally be adequate, but advice on the protection of particular units will be given, if required.

If empty of oil: spray the gear case interior with rust preventative oil compatible with lubricant recommended for service conditions.

If filled with oil: operate at full speed once per month for not less than 10 minutes to ensure liberal coating of all internal parts with oil.

For indefinite storage: completely fill unit with oil ensuring complete submersion of all internal components and shafts should be occasionally turned by hand. When unit is returned to service, drain and refill with new oil to correct level.

Spare parts

Information relating to spare parts is available on request.

RENOLD WM Series - Lubrication Information

Oil Lubrication Worm Helical Gears

The correct fill of oil for the unit size and mounting position can be found. Only good quality oils should be used, such as those listed below, as the use of inferior or unsuitable products may cause rapid wear and possible damage to the gearbox. Some EP additives such as Sulphur can attack Bronze especially at operating temperatures above 80°C and therefore should be avoided.

Oils with three viscosity ranges (Light, medium and heavy) are listed below, the correct choice depends on the application, operating speed, load and temperature. Temperature and speed can often be the main factor as it affects the operating viscosity. If the unit runs below the catalogue rating and operates at a temperature below 60°C then a light grade oil should be used. Operating at catalogue rating with temperatures up to 100°C require a medium grade, with higher temperatures and loading heavy grade oils should be used.

If the unit is operating with gear speeds below 2.5 m/s (500ft/min) then the next higher grade should be used. Using too heavy a grade than required will result in reduced efficiency, too light a grade will result in premature wear, if in doubt ask Renold Gears Technical Department.

Which Oil to Select

There are three main oils Mineral, Synthetic - Polyalphaolefin and Synthetic - Polyglycol. Mineral oils tend to be lower cost, have a shorter life and are less efficient. Synthetic - Polyalphaolefin can operate over a higher temperature range, are more efficient, give higher ratings and have a longer life and as such are preferred. The use of Synthetic - Polyglycol are not recommended without prior discussion with Renold as special paints and seals are required. If necessary a list of recommended food grade oils is available on request.

Notes: Maximum torques stated apply for uniform loading applications (Starts/Hr <=5)
 For applications with combinations of high torques, overhung loads, or nos. of starts, consult Renold technical dept.
 For torques greater than the stated maximum, consult Renold technical dept. high tensile steel output shaft must be specified.

Notes: Maximum torques stated apply for uniform loading applications (Starts/Hr <=5)
 For applications with combinations of high torques, overhung loads, or nos. of starts, consult Renold technical dept.
 For torques greater than the stated maximum, consult Renold technical dept. high tensile steel output shaft must be specified.

Notes: Maximum torques stated apply for uniform loading applications (Starts/Hr <=5)
 For applications with combinations of high torques, overhung loads, or nos. of starts, consult Renold technical dept.
 For torques greater than the stated maximum, consult Renold technical dept. high tensile steel output shaft must be specified.

Notes: Maximum torques stated apply for uniform loading applications (Starts/Hr <=5)
 For applications with combinations of high torques, overhung loads, or nos. of starts, consult Renold technical dept.
 For torques greater than the stated maximum, consult Renold technical dept. high tensile steel output shaft must be specified.

Notes: Maximum torques stated apply for uniform loading applications (Starts/Hr <=5)
 For applications with combinations of high torques, overhung loads, or nos. of starts, consult Renold technical dept.
 For torques greater than the stated maximum, consult Renold technical dept. high tensile steel output shaft must be specified.

Renold Gear Unit Drive Combinations and Custom Unit Capabilities

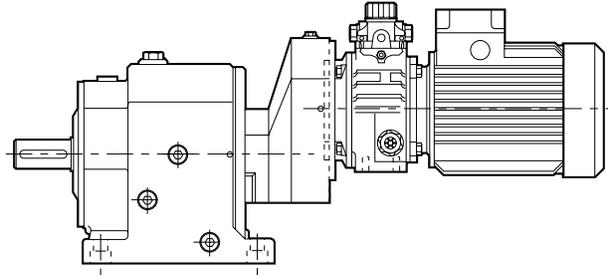

Combined jPM wormgear units increases the maximum unit ratio to 4900:1.

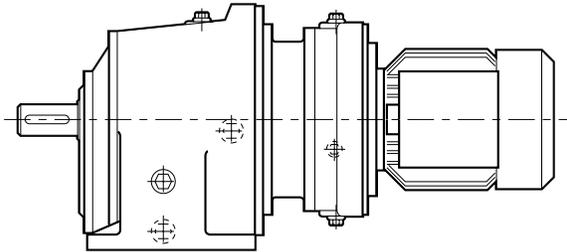

To extend the catalogue ratio of TW Series wormgear unit or to allow output shaft back driving a RS Series helical unit first stage reduction can be used.

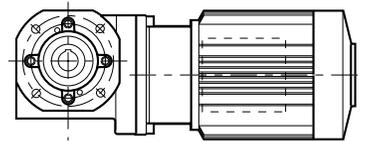

Wormgear or helical gear unit can be supplied as a package often with motor, couplings on the input and output shafts or chain drive, all mounted on a base plate.

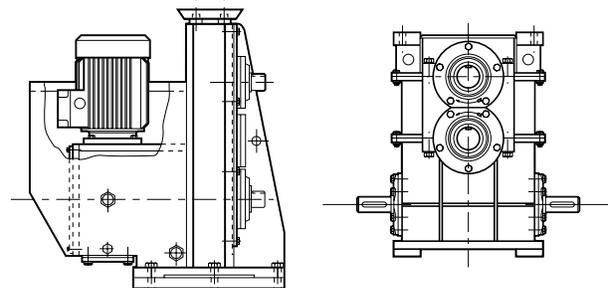

Combined triple and single reduction RP Series unit using a Carter disc unit as a prime mover. This offers a 5:1 variable speed range at low speed.

Motorised 'GMF' range flange mounted RS Series combined with 'GM' RS Series.

Custom units can be supplied such as stairlift or homelift units, motorised wheelchair and roller shutter drives.

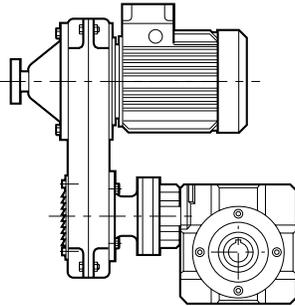

Special purpose units can be manufactured using bevel, helical and wormgear products, in cast iron or fabricated steel cases.

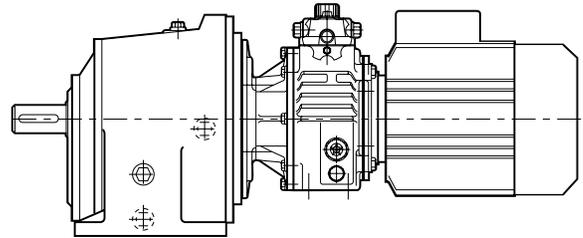

Renold Gear Unit Drive Combinations and Custom Unit Capabilities

All of the Renold gear products are designed and built to a modular concept and can be combined in such a way as to give the best drive package to suit the application.

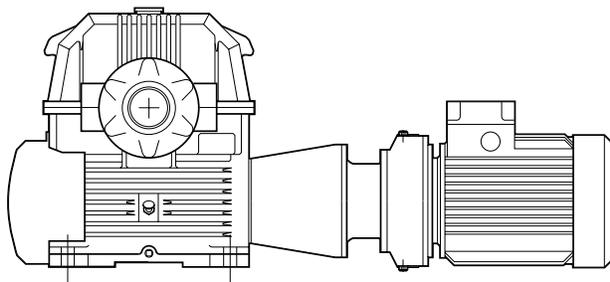

The following are some suggestions.

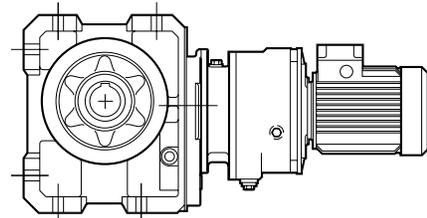

Carter belt variable speed drive driving a JPM wormgear unit giving up to 8.75:1 variable speed range with a right angle drive.

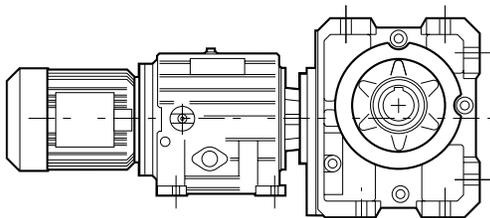

Carter disc variable speed unit, combined with electric motor and RS Series helical unit.

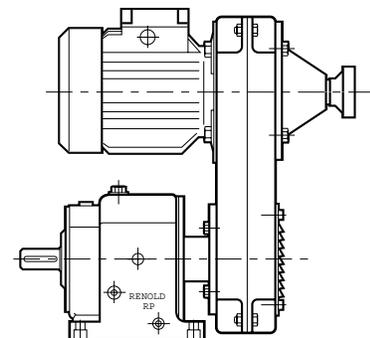

TW Series wormgear unit ratio can be extended beyond the catalogued figure by adding a helical first stage reduction such as RS Series or RP Series.

Combined flange mounted RS Series and ePM Series - PH Type helical/worm unit has a maximum ratio capability of up to 22,000:1.

Motorised Carter hydrostatic variable speed unit with a 27:1 variable speed range combined with e.PM Series - PH Type helical worm unit.

Carter belt variable speed unit combined with an RP Series single, double or triple reduction.
